

Acoustic baselines rival HuBERT in AN19

Historical test-fold refits: three-fold mean z, with HuBERT shown at Tr-24

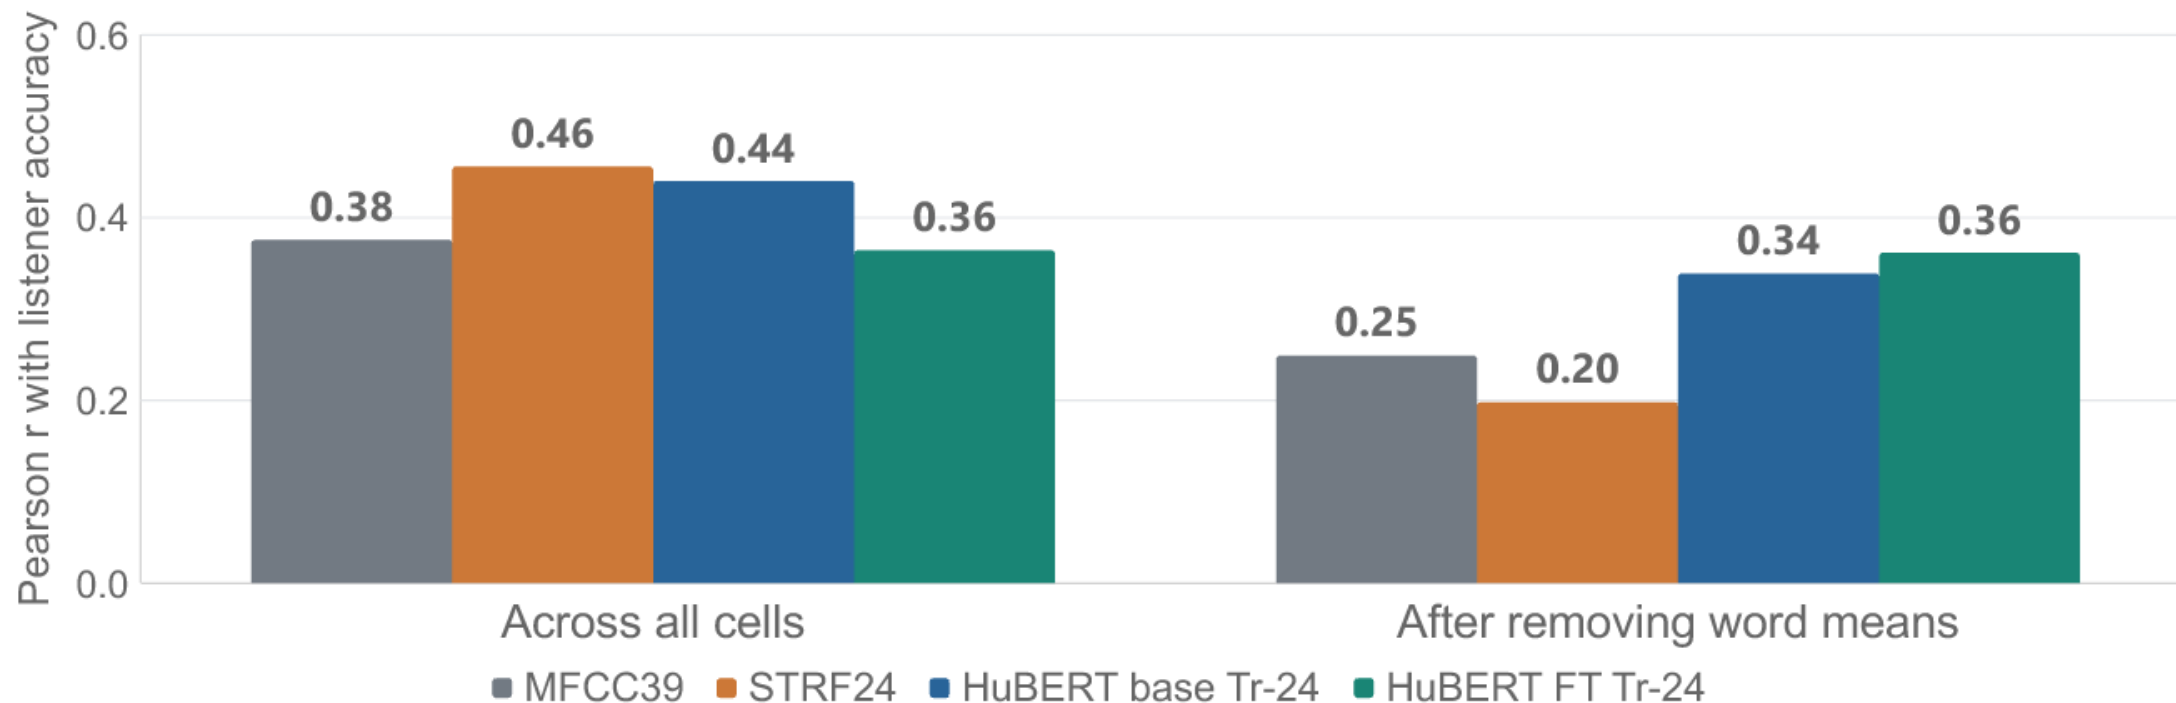

AN19 STRF also matches the best base layer: 13.94 vs 13.69 (Tr-12).

X21 shows a clearer HuBERT advantage. The cause of this difference remains open.

Descriptive rankings. A paired test of representation differences is still needed.

A clue in AN19: differences between words

Current fixed-distance predictors: correlation with mean listener accuracy

After word centering, HuBERT has the stronger association.

Word-dependent variation is a plausible contributor. Its acoustic source remains unresolved.

574 condition × recording cells, 48 words. Equal cell weights. Descriptive r, without inference.
